

Is the lithium battery factory harmful to the body

Overview

Lithium is used for many purposes, including treatment of bipolar disorder. While lithium can be toxic to humans in doses as low as 1.5 to 2.5 mEq/L in blood serum, the bigger issues in lithium-ion batteries arise from the organic solvents used in battery cells and byproducts associated with the sourcing and. Much of the world's lithium is extracted by tapping into underground “brine” deposits, pumping water rich in lithium salts into large evaporation ponds. Lithium isn't the only problematic metal in lithium-ion batteries. Cobalt, which can constitute a significant amount of the cathode material, is toxic. The organic liquids used in most electrolyte formulations are both mildly toxic when ingested and can irritate the eyes and skin. Inhaling their vapors may cause nausea, vomiting. The cathode material in some high-density lithium-ion batteries includes as much as 80% nickel. Coal-fired nickel smelters, such as the ones found in Indonesia, release carcinogenic sulfur dioxide into the air, and communities near.
