

Is the source of the current a battery

Overview

Most batteries produce direct current (DC). A few types of batteries, such as those used in some hybrid and electric vehicles, can produce alternating current (AC). Batteries produce DC because the chemical reac. A AA battery is a type of dry cell battery. The term “dry cell” is used to distinguish it from an earlier wet cell battery. A battery is typically made with a zinc can as the anode and a carbon rod as the cathode, with an electrolyte of pot. A generator is a machine that converts mechanical energy into electrical energy. The type of current produced by a generator depends on the design of the machine. Alternating current (AC) generators were. Batteries are a common power source in many electronic devices. They come in a variety of shapes and sizes, but all batteries have one thing in common: they produce current. This article will explain the difference betwe. A battery is a source of chemical energy. It converts chemical energy into electrical energy. The most common type of battery is the lead-acid battery, which is used in cars and trucks.
