

Output power of two inverter models

Overview

Inverter stacking connects two inverters to create a 120/240V split-phase output, effectively doubling the voltage for large appliances. When designing a solar energy system, a common question arises: can you achieve this by simply connecting two inverters?

The answer is more complex than a simple yes. As we know, the basic function of the inverter is to convert DC power to AC power because most of our electrical needs are for AC. The inverter is connected directly to either the power source (solar PV array or wind turbine) or the charge controller, depending on whether backup storage batteries. Has anyone attempted and succeeded at paralleling two identical model Pure Sine Wave inverters to double the power output?

This is a common feature of some of the larger the All-in-One inverters, and even a couple of smaller power stations (i. This setup is ideal for off-grid power applications, especially when powering significant loads.
