

Principle of lithium iron phosphate chemical energy storage power station

Overview

Lithium iron phosphate battery (LIPB) is the key equipment of battery energy storage system (BESS), which plays a major role in promoting the economic and stable operation of microgrid. Based on the advancement, the operation strategies of BESS are proposed under different power. In the context of the global energy transition and the constant development of smart grid technology, microgrid has become an important component of smart grid, characterized as follows:

2.1. BESS planning and solving process

In this paper, Fig. 1 illustrates the BESS planning and solving process, including two parts: the data input and parameters processing, and the simulation data. The simulation data mainly include predicted electrical load, light intensity, wind speed, energy price. Fig. 5(a)-(c) show the annual simulation results. In this paper, a multi-objective planning optimization model is proposed for microgrid lithium iron phosphate BESS under different power supply states, providing a new
