

# Solar Photovoltaic Voltage Module

## Overview

Used just for classification, it is not a real voltage you are going to measure. It is not a fixed voltage either and, normally, it is not mentioned in the specification sheet of a PV module. Some of the common parameters mentioned in the specification sheet are listed in the table. This voltage is checked with a voltmeter across the output terminals of the solar panel module, without connecting any load. This parameter is  $V_{oc}$ . This is the voltage available when the panel is connected to a load and is operating at its maximum capacity under standard test conditions. Most solar panel manufacturers specify  $V_{mp}$  to be around 70 to 80% of the  $V_{oc}$ . This current is obtained when the solar panels are producing their maximum power. It is the amperage you would want to see when connected to solar equipment. This is the value of current obtained when the positive and negative terminals of the panel are connected to each other through an ammeter in series. This is the highest current the solar panel cell can deliver without any damage.  $I_{sc}$  is.
