

Solar photovoltaic panels of different watts

Overview

Solar panels of different watts should not be used together because they have different voltages and amps. The system will always choose the lowest voltage or amp, which will reduce efficiency and power output. Though mixing different solar panels is not recommended, it's not forbidden and things would be ok as long as each panel's electrical parameters (voltage, current, power) are compatible. Example: 5kW solar system is comprised of 50 100-watt solar panels. Alright, your roof square footage is 1000 sq ft. Can you put a 5kW solar system on your roof?

For that, you will need to know what size is a typical 100-watt solar panel, right?

To bridge that gap of very useful knowledge needed. Solar panel wattage refers to the amount of electricity a panel can produce under ideal sunlight conditions. It is one of the most important specifications to consider when choosing a solar panel for home use. Moreover, panel output efficiency directly impacts watts and the system's overall capacity. You might have a high-wattage panel from one manufacturer and a lower-wattage panel from another.
